《江汉大学大学外语课程免修规定》已经大学外语教学指导委员会审议通过，现予印发，请认真贯彻落实。

Table 1. Summary of the 1000 Genomes Project

Project	Number of individuals	Number of SNPs	Number of regions
---------	-----------------------	----------------	-------------------

The 1000 Genomes Project is a large-scale genotyping project that aims to provide a high-resolution map of human genetic variation. The project has identified over 80 million SNPs across the genome, with a density of approximately one SNP per 100 base pairs. The project has also identified several regions of high genetic diversity, including the African continent and the Indian subcontinent.

The project has also identified several regions of low genetic diversity, including the European continent and the East Asian population. The project has also identified several regions of high genetic diversity, including the African continent and the Indian subcontinent.

The project has also identified several regions of high genetic diversity, including the African continent and the Indian subcontinent. The project has also identified several regions of low genetic diversity, including the European continent and the East Asian population.

The project has also identified several regions of high genetic diversity, including the African continent and the Indian subcontinent. The project has also identified several regions of low genetic diversity, including the European continent and the East Asian population.

The project has also identified several regions of high genetic diversity, including the African continent and the Indian subcontinent. The project has also identified several regions of low genetic diversity, including the European continent and the East Asian population.

Region	Number of SNPs	Number of individuals
African	10,000,000	100
European	10,000,000	100
East Asian	10,000,000	100
South Asian	10,000,000	100
Admixed American	10,000,000	100

The project has also identified several regions of high genetic diversity, including the African continent and the Indian subcontinent. The project has also identified several regions of low genetic diversity, including the European continent and the East Asian population.

The project has also identified several regions of high genetic diversity, including the African continent and the Indian subcontinent. The project has also identified several regions of low genetic diversity, including the European continent and the East Asian population.

The project has also identified several regions of high genetic diversity, including the African continent and the Indian subcontinent. The project has also identified several regions of low genetic diversity, including the European continent and the East Asian population.

The project has also identified several regions of high genetic diversity, including the African continent and the Indian subcontinent. The project has also identified several regions of low genetic diversity, including the European continent and the East Asian population.

大学法语

学生参加学校组织的全国大学法语四级考试达到相应水平，可申请免修大学法语未修课程，并记载相应成绩，具体如下：

免修条件	CFT-4 成绩合格	CJT-4 成绩优秀
可申请免修课程	大学法语①、大学法语② 大学法语③、大学法语④	大学法语①、大学法语② 大学法语③、大学法语④
成绩记载	90分（①②③）	95分

	大学德语③、④	
	85分`①②③`	90分`①②③`
成绩记载	80分(④)	85分(④)
附加说明	如前期已经修读部分课程，所修课程仍以实际修读成绩记	

以上规定解释权在教务处，从2022年秋季学期开始执行。凡有关规定与本规定不一致的，以本规定为准。
